First of all, you dont want to do that(renege aint programable, use ut2003 instead).Second, your not getting to a point. Please say wich progamming langue you use.Third, I can help you but thats more of a haxor methode. Anyways here it goes.So you must search the Ram for Renegade (when its running of course, like duh), then you must get to know the ins and outs and than mabye you could track down the skins and change them. But when you do that every virus scanner would see it and your program would be deleted.
