if people host a listed server or something close to it at port 4848

i end up looking at some joining text (after testing brandwith completed)

and i don't join it :S

any normal detictated server at 4848 hostport will work
(like Fragzone.EXE [Renguard] (217.170.20.40:4848))

might be a mistake at server?
any fix for it at server or my router?

wanna be able to join any server how lame they could be don't matter
