The future can be changed imo.... Because, if you think about it, the future hasn't happened yet, so it is "changed" by everything that happens. For example, I'm writing this post, which means that people will read this and most likely reply to it. But if I don't write this, then no one would read it and it would get no replies. I don't think that it is possible to jump to a part of the future, but it is possible to 'get there'. I'll explain: When you get close to the horizon of a black hole, time slows down. For you, time would go as normal and when/if you get away from it then it will seem that time has gone as normal. But for everyone who watched you, you have been going slower and slower. So for you, you may have been there for say, a few days, but for everyone else, you have been there for a few years. So you would be in your future, but their present.

I also think that it may be possible to go back in the past, this is just a theory of mine, but things can be positive and negative right? Like electricity. Let's say normal gravity is positive, and it attracts objects towards it. It must be somehow possible, to have a negative gravitational field. I don't think this actually exists anywhere since gravity is determined by mass (I'm pretty sure it is anyway), so the matter would be thrown away and the field would disappear. But let's say there is a way to make it last, and that it was very strong, like a black hole. I think it would probably be possible to go near the horizon of the white hole (let's call it that since it would be the opposite of a black hole), it should have the opposite effect to a black hole. In other words, when you come out, you should be in the past.

And about the things about God that I read here, I believe in God, and I also believe in the theory of evolution. If you think about it, where did all the matter that makes up the universe come from? It had to have a beginning, so I believe that God made the universe. But there is sufficient evidence to make me believe that things have changed due to natural selection.

Also, I've often thought about what was around before the universe existed. I think that there was another universe which existed before our universe. Think about it, if you believe in the 'Big Bang' then it must have been something similar to a black hole, because it was just a massive lump of matter, which exploded. But the ball of mass was created when a previous universe collapsed on itself due to the gravity of the contents of the universe, and created that ball of matter, which then exploded to create our universe.

Which brings me to another thing which I have recently thought about. I read in a newspaper a few days ago, that Prof. Hawking has changed his view on black holes, and that they spew out their contents after a certain amount of time or something. This makes the Big Bang believable for me. Since I think that the big bang must have been a black hole, or something similar, so I think that black holes spew out their contents, just like the big bang did which created our universe.

There's something for you guys to think about, just like I have
