Bl00dAngWhat does your bot do ruddles?
Its main purpose is to log the IP addresses of people who play on the server and link them to names. Allows us to track people on the server better. Im also planning on adding in a few commands to the rec system, if I can get sqlite.dll working (and if brenbot doesn't lock the database). Will also link it to the ssaow logs if the next brebot doesn't do a good job of it (although I have faith   ) to allow IRC to see who bought what/who killed who ect.

Bl00dAng Is it a server side client or something else?
Its server side.

Bl00dAngHow can i learn the language? Do you know of a tutorial?
Pick a language. Brebot is written in Perl I think. While its a good language its not one I know well so I went from C++. If you don't know what to use VB.NET is a good one to start with.

Bl00dAngis your bot run in a command prompt window or in a normal window like Blaze Regulator?
Console window (command prompt). No need for GUI like BR as its only me thats gonna be doing the config (might make some of it public, but atm no plans to make the whole thing public).
