The solution is:

- Download PCBugDoctor version 1.0.0.4 (you will find it with google.at)
- install it
- register it with a correct name and correct s/n (you will find them in the internet too)
- Run PCBugDoctor and and klick "start scan now"
- The programm will find some bugs and you can klick "fix errors now"

Now renguard should run without any problems. It's possible, that a few days later the problem will occure again, then run PCBugDoctor again. (In any case you should run PCBugDoctor every few days. Your PC will thank it to you)

Please write me an e-mail, if this solution has worked
