100C? you must mean 100F cus 100C is 200+F and well that will just burn the processor up. You can get it up to about 100F without a problem.

I have P4 and AMD's and I keep them all at about 80-95F. Those are the best temps to have them at. You can get them a lil higher but I wouldn't say 100C/200F ever unless you only want your comp for a few months...

Also remember to cool your motherboard. and keep dust off em, or you'll just burn it all up..
