Yeah, AMD processors work at slower speed (= less clock cycles, Mhz), but they do a lot more work per each clock cycle. That's why an AMD Athlon 3000+ can compete with a 3Ghz Pentium, even though Athlon only runs at a little over 2Ghz.

Intel is following AMD's footsteps in this though. In close future, the amount of Mhz isn't even shown in the processor name, they just make different brands to reflect the CPU's general capabilities. The amount of megahertz won't mean very much anymore.
