Neither, it just fried and the motherboard got bust also I think.

I wasn't really bothered about it because I recently was given an AMD AthlonXP 2000+ at the time

2 week ago, I upgraded to an AMD AthlonXP 2600+ I again forgot to put the HeatSink on, but luckily, I forgot to press the on switch on the PSU to whcih then I noticed I forgot to put it on
Its all 1337 now anyways
