---

Well my renguard hasn't been running properly lately, and i dont know what is causing these weird errors i keep getting.

I have been having renegade crash, to see renguard loaded with a message saying i was trying to use the Lan exploit. I have still yet to figure out what that means, but far as i know, it happens randomly.

Now today i just tried to start renegade, to get an error saying:

```
[20] Trying to connect to server #1...Failed
```

```
[20] Trying to connect to server #2...Failed
```

```
[20] Trying to connect to server #3...Connected
```

```
[20] Server is not responding. Trying next one
```

```
Unable to initialize network, perhaps your firewall is incompatible with Renguard.
```

Now whats odd is that i have not changed my internet connection , or firewall or anything in that matter for ages. I was able to play on renguard servers fine just up until today, and now its impossible to connect.

Now the problem is that one of my firewalls is built into the router, and i do not know how to change the settings to allow me to connect, but if anyone can help me out with some information on how to do this, it would be great.
