Most well known rule of arguments:

In the absence of a factor that changes the variable, the argument continues with the original set of parameters.

Without specifying that the distance had changed from at the head to something other than that (being an unknown distance), you continued to argue given the original parameters. Those being with the distance established at close quarters.

Apparently you fail to realize this, though I will admit assuming people can read minds must do wonders with your "argumentative win percentage". YOU must never lose! Don't like the parameters of the argument, change them without telling anyone! Brilliant
