Firefox has been identified in having code that could cause damage to your computer.

Exploit:

Mozilla and Firefox are prone to a vulnerability that may permit a malicious Web page to spoof the source of a download.

This may be used in a social engineering attack that entices a user to download a malicious file under the assumption that it is coming from a trusted source.

I think this was recent as it was in a mag i recently read. It has also been pacthed and in the nightly builds section.
