tooncyI don't want to live in a world where computers become consiousIt's a common fear among most people. I do not fear conciousness. If the computer truly becomes concious, then it should grow like a human (even if in its own, computer, way). Otherwise, you end up with the same likes of a child having godlike powers: fear the tantrums.

Remember: conciousness isn't intelligence. Intelligence cannot be learned or programmed without dire consequences. It can only be learned.

If the computer learns and grows, it should then also have an attachment to those whom have helped it, and with that attachment, value and possibly share the opinions and values of those whom it values.
