Well Pheonix it's not all that difficult to put out that kind of power. The amount of energy utilized in some of the worlds largest super colliders, are much much much much higher than that.

And to SFE. That is a valid observation. The idea with not being able to "Touch" anything however is the first thing I said, not the planck length. You are correct however that if your a planck length away from something it is like your there since there is no inside. But realistically, at that point you are both there, and infinitely far away... So that observation kinda destroys itself. What I was saying earlier about touching. Is when you feel something, you are feeling the force it's atoms exert on your atoms by way of electronegativity. We don't actually touch anything.
