O.K time to continue. So, I connected Desktop though USB(had to install drives for it) to the cable modem, and laptop through the LAN cable.

Results: It did not work .

Then I tried to see if the LAN cable can replace the the cable that was there before, and it did not work, which is strange, because this modem should support this LAN cable. So I will probably have to use the old cable.

Then I tried if the USB(Type A To Type B(cable that I took from my printer)) cable connection to the modem worked, but it did not, so Maybe I will need to buy similar USB Type A To Type B cable that will work.

QUESTION: Are there different types of "USB Type A To Type B" cables, just like there are different types of the Ethernet cable(LAN, and regular Ethernet)?

Now I will try to use The USB cable withe the laptop. I don't think it will work, but it is worth a try.
