its a wrong alarm.

hackers use to put trojans in that SKVB.sys and NAV now always kills that sys if you start games like renny(RG) or eDonkey, they use it to make the gmaes more safe or as copy protect.

I got that too, 2 days ago.

How to fix that Norton Shit:

Download my attachet archive, deactivate Norton Auto Protect (start NAV, click options at the top, Norton Anty Virus, remove the tick left to "Active Auto-Protect", save settings close NAV).

Then extract the archive to your desktop and start SVKP_fix.cmd press, Yes and OK and run the proggy. After this reactive your Norton Auto Protect and everything should be fine.

THIS WORKS!~!!
