Ipod are terribly overprised. Also: 20 GB, WTF??? You'll never use a 10th of that. If you're gonna buy a 20 gb player, then at least buy one that can also play video...

Quality of songs going up? If you have a 5 minute song that takes 10 MB, that's A LOT and you will never hear any quality difference between cd-quality and higher quality. Your ears aren't made to hear a difference . So that would make about 2.000 songs. Tell me: do you really need that on your player? Or can you just put around 200 on it and change those after some weeks?

You should also consider that if you buy your cd's, you must be a really rich bastard or a disk jockey to have over 2000 songs. If you download them (naughty boy, do not do that) then you will hardly ever find MP3s that are more than 3-5 MB because that slows down the downloads. People just keep an acceptable but not too high quality so it transfers rapidly.

So yeah, I'd say buy a very small (in size of the player) around 1-5 gig player that suits everywhere. Ipod's are a pain to cary: wouldn't u prefer something that is quite a bit smaller than a mobile phone? I do think so that's always handy!

It will cost quite less too.

That's just my little input on this intresting topic.
