If your favorite servers are listed on GameSpy, then you can right-click on the server and then select "Copy IP Address". Then go to Renegade IP (or whatever program you have) and paste the IP (control-v). You'll probably need to separate the port, though. The port is everything on the right-hand side of the colon.

If your favorite servers are not listed on GameSpy (or you don't like to use GameSpy), you'll need to contact your favorite servers' owners and ask them. Unless they're incompetent, they'll be able to help you.

Edit:

In any case, a direct connect will likely not solve your wireless connection issues. I recommend moving to wired connection. If that's not possible, then make sure your transmitter and receiver are as far away from metal objects as possible (including your computer chassis). Metal objects tend to warp the RF signals used for wireless internet. Also, 802.11b is especially sensitive... if possible, upgrade to 802.11g.
