Using the XWISC tool should have no effect. That tool was designed to create a hosts file on your windows machine to fool it into connecting to XWIS instead of WOL. Now that the migration has occurred, the WOL DNS names point to the XWIS servers, so using XWISC to revert to WOL just removes the hosts files and renegade uses the normal DNS entries, which point right back to the XWIS servers.

There is absolutely no interaction between a dedicated server and XWIS that will make your ping time to the server higher now than when the server was on WOL. Note that the ping times you see in the server list, are calculated from a combination of pings to various servers within the WOL/XWIS network, it's not a reflection of your ping to the server itself.
