---

although brenbot has a built in function i would recommend to use wolspy  
the BR forwarding to gsa is way outdated and doesnt really work

about your config..

RemoteAdminIP = (leave it blank, you can set it to 127.0.0.1 of course if you want)

RemoteAdminPort = 12234 (something with 5 digits)

RemoteAdminPass = 12345678 (8 digits!)

make sure u have the same in brenbot.cfg when you change it!

now run wolspy setup

it should detect your server.ini content without any problem. the warning about the ip in wolspy  
can be ignored. it will run anyway
