Read complete instructions before you start.
Uninstall the mouse hardware and reboot. In Win XP go to control panel > system > in system
properties go to hardware tab > device manager > mice and other pointing devices. Right click
and select uninstall > ok > yes to reboot. Windows should start the device manager on boot up
and reload the drivers from service pack 2.
If not, then you're screwed. No, make a restore point first, then uninstall the drivers. If you installed
any drivers after installing SP2 you can simply roll back the drivers. Use the same path as above
to mice and other pointing devices. Right click and choose roll back drivers.
If you use GNU/Linux, disregard everything you see here.

Also, before you begin set the msconfig settings to normal start up. Win key + R > msconfig > ok
