i am currently looking at winrem and fdstalk.exe i dont know how to get them working they both look like they have executed(worked but ouput nothing) but fds shows nothing. my biggest problem is getting text from fds to the bot.

btw: i will be relasing the code that i make as well as binarys for linux and windows, well documented! so it is easier for others to create their own bot.

as soon as i can get my bot and fds talking it should be easy (for me) from then on. i have already though of code that i could use.
