Just hope you don't need to get a new PSU in order to use a different mobo. Also make sure that case fits standard ATX mobos.

To be honest, that CPU sucks, 512mb of RAM isn't enough, and it doesn't sound like you got much of a video card. I think you made the wrong decision.

Edit: Use the image I posted above as a guideline to what you should be getting. Add a case, and maybe aim a bit lower with some of the parts to stay within budget.
