i really doubt any of your current systems would be sufficient enough to create powerful plugins, although your commands system has potential, it would need a lot of upgrades as you're basically writing your own language... it's best to stick inside DLLs and stick with a language well known (eg, C++)

thanks for the advice! i am doing it in c++, i have a 2.0 with this implemented. it took a long time but i did it, well here it is: [http://www.help-linux.com/stuff/H-L\\_Bot-2.0.zip](http://www.help-linux.com/stuff/H-L_Bot-2.0.zip)

it is very small at the moment but i'm getting the hang of writing it. the code that parses plugin.txt is already capable of parsing multiple things but i am tired and cannot think logically anymore. i have included a sample plugin.txt, that implements the !website command. enjoy!
