help-linux wrote on Fri, 08 September 2006 12:35i am so P***ed off with windows that i could lose all the work i currntly have just to get it off with my computer.
reason? i couldn't list there is so many things wrong with the windows generation.

first off windows is very unstable and crashes often, poeple can say this never happens but that is because they don't push like i do.

to stop it crashing at the moment i have overclocked the proccessor to the max and it over heats regulary. i have enough spyware to give tell the whole us when i go to the toilet.

i am going to install suse linux 9.1(i know it is a earlier version but i like it). i was wondering if there is a way to get rengaurd working with cedega. i was wondering if i run cedega twice once to run Game.exe and the second to run Game2.exe?

cedega runs renegade very well.

does anybody have problems with windows?
EG: you have renegade running in the background with rengaurd, renegade server is up and then level edit wont run or windows doesn't even seem to try and load it or it brings up a white window?

in suse linux if anything like that happens like the white screen it starts a crash handler that stops it *IMMEDIETLY* not it ten minits or an hour.

also the multitasking on suse linux is incredible, nothing windows could match. although i need windows for 3dsmax i can use Vmware which is good and windows seems to be more stable running in it.

ill post a screenshot of it later when i have everything installed.

I've been running Windows for years and have not had any "unknown problems". All the problems I have had with my computer were caused by me, and I know it. I have never had problems with Windows crashing, nor running slowly.

On the other hand, I don't see how you can possibly think overclocking your central processing unit is going to help.

And if you have spyware/viruses and other things, you really need to be more careful at what you browse on the internet, or stop looking at all that pr0n.
