ok this morning my new GF4 Ti 4200 128MB AGP8x came

now i have installed it correctly it works now this is the problem
i can play EVRYOTHER GAME at max details high reso with no vid lag whatsoever

now i play renegade i get shity 20 FPS WTF!!!
it ocasionally stays at 50 maybe 60 if i am lucky but it goes lower than what my bloody GF2 mx400 did! and that was on a 20 player server now imagine a 36 player...i used my GF2 on that and i got 30 FPS..i dont even wanna think about what i will get with this card

anyone can help me?

i noticed the GFX in renny is alot better with the blood spatter and effects
renny is run in 800x600 32-Bit colour
high details (everything i ran with me GF2)
monitor refresh rate is 75
