Couldn't you just make a small program (ProgramX) to send the logs over something like IRC to the Seye program? Ie:

Server writes logs. (delay) ProgramX reads logs, ProgramX sends logs over (i'll just use IRC) IRC and then the Seye program reads them and displays them. (that would mean the Seye program would need an IRC type client ability)

That small ProgramX could then be configurable server side in terms of delay etc. A well coded one would also be very minor in terms of performance hits. (reading and sending a text file isn't very resource demanding)

The major point of this is so that the parsing and graphical end of the work is done on the machine that's going to be viewing it, rather than the server.

Tell me if I've been a noob. ./

IRC = bad idea

direct UDP connection would be a good idea imo
