Subject: Renegade crashes after I installed additional memory

I've tested the memory and found nothing erroring with it, and everything else runs correctly, but Renegade now crashes after a half-hour or so with a crashdump message of

"Exception occured at xxxx .text:xxxx (game2.exe)

The Renegade Client tried to write to address xxxx .text:xxxx (game2.exe)"

There is much more in the dump file, but this is the section that changes with each writing. I'm going to reinstall Renegade, the patches, and the Renguard client and cp2 later, but if there is a quick fix I can use before this, I would be happy to know of it.

Thanks for perusing this...
