I've found that WMM (the only software I know how to use; VDub confuses me) makes my half-size (from full at 1024x768, 25 fps) fraps vids look only slightly better at 1.5 or 1.0 Mbps compared to 768Kbps. The only reason you'd need the Mbps bitrates (and therefore increased filesize) is if you have chat text that needs to be legible, which I doubt is the case for you at this point. Also note that if you use a bitrate of 768kbps or higher, WMM changes the resolution to 800x600, and for me (since my original resolution is 512x384), it actually makes some features more visible, but a bit blurrier. As for file compression, .rar or even .7z ultra compression don't really make much of a difference after you compress your videos, as they'll only take off a couple MB at most. You can also use features in the timeline area and menu to splice clips or parts of clips together, and then make 1 large trailer.
