HI there. I just went throught all (and I mean ALL) of the solutions posted here on the forum. From copying manually to downloading """"""debug files"""""". The two install files that I dowloaded, one was getting me an error and the other was only making the septup crash faster.

Here is my situation. I am on WindowsXP Home. When I try to install Renegade, my computer goes slow and a "Microsoft Error report" thing is apearing on the screen. So I can't even get into the installation of the game. Before I was with WindowsME and the game was running fine. For hardware requirements, I think I am ok.

1Ghz PIII
512 RAM
Gforce4 Ti4600 (with latest drivers)
The other parts are not really important.

Please, can someone give me a real solution for my problem. Thank you.
