This, imo is pretty tricky. It needs to be done, though, I'm hoping a lot of the people on these forums are as smart as they say they are. No, this is not homework or something just to test everyone. It is for a program i am making.

$$L = (X+S/2)*W/S - ((O*W)/100)$$

I need to find X when i know L. If someone could do this i would be very grateful.
