Why does Renguard not work?

What does renaming scripts.dll to scripts-custom.dll and then renaming scripts2.dll to scripts.dll do? (That restores the default Westwood scripts)

What were you doing when Renegade crashed? (aside from playing, more accurately, like "I was repiaring my tank")

And finally, does Using the latest version of the scripts help? (If you're using 3.4, then your game will crash as it contains a VERY NASTY (so nasty it deserves capital letters) memory leak)

(Oh, at a guess, your system actually does contain some video RAM, but EAsySysInfo didn't find it, lol)
