Any high-end card from at least the last 4 generations, and any mid-range card from at least the last 2 or 3 generations, should be able to run Renegade at higher resolutions, and if it's not bottlenecked by a 128-bit memory bus (not sure if the latest mid-range cards still use that or if it's bumped up to 256-bit), then you'll be able to use high levels of AA and AF as well. As long as you're not buying a dinosaur, any video card these days will handle Renegade no problem.
