In server.ini check the "port". You can set it to whatever you like, for exemple 5555.

Then go to your router admin (check your router's manual) and search for "virtual server" or "forward ports" or "nat" (sometimes it's called differently). Forward udp port 5555 to the LAN-ip of your server (to check this, do start menu -> run -> cmd -> ipconfig -> enter (it will probably be something like 192.168.1.x)).

If you needm ore help on forwarding ports, check www.portforward.com !
