Features that are advertised but that nobody fucking uses**

SIMPLE BLOWS? WHAT? LOL. GMax is a fucking dumbed down, free version of 3DSMAX, this comparison can't be applied to OSX because you have as much fucking freedom as you do on any other operating system.

Just the fact that we're EMULATING WINDOWS is an insult to it, it's like fucking legacy bullshit to us. But I haven't found myself needing to emulate anything save for Steam. lol@"Macs are useless compared to Windows" WHO THE FUCK ARE YOU KIDDING MAN? You have no fucking idea what you're talking about. Final fucking Cut Pro is an industry standard, just like Macs are a standard for graphic design (tip of the iceberg, there's a lot more to Macs than you think, lol).

Hate him or not, Steve Jobs knows how to market stuff, and those Pixar movies are always hits.

... I think you misread what I said regarding penny pinching. You guys refuse to buy Macs because they're "more expensive" or whatever, you try configuring a system that equalizes the iMac (24" screen and processor alone make up for over 50% of its price... I'm talking about the 24" 2.8 Merom XE one).

I don't give a shit about USB for peripherals like keyboards and mice, but fucking storage? Honestly? Or cameras? USB 2.0 can't match the performance of Firewire in any way in those areas. Firewire is the best thing since DVI (digital video is something they've had for a long time, in the mean time we're still seeing VGA out on PC laptops) and I can only hope F800 will replace USB 2.0, but it probably won't even though the standard sucks total ass.

If F400 feels natural (as if the drive was in your tower), I can only wonder how quick F800 feels.

Wow shit you so didn't read what I said about the mighty mouse, speaking of mice, you're talking as if we were limited to Apple's mighty mouse (wireless and wired). Well, no. I'm using a Logitech G5 with my iMac and the mighty mouse on my laptop, sometimes I also use an off-the-shelf black mouse depending on surface conditions.
