Chuck Norris wrote on Thu, 08 November 2007 10:32 PSU recommendations are often overstated to account to low quality ones. A "normal" 500 watt PSU is probably only a crappy quality 400 watt one that can peak to 500 watts. You'd be surprised what 400 watts will power, maybe even 350. 95% of people would easily get by with a quality 500 watt PSU.

well thats what i got right now is the antec 500w high efficiency psu. so it should not be the psu anymore. it cant be the temps since the are all normal now. i updated my vid card drivers to the latest ones. i have yet to do the same for my mobo since all the bios and drivers were installed from the cd that came with it.
