No, that isn't what I meant. The grips on the roads wouldn't technically advanced at all, other than being able to allow a car to freely switch or change lanes when needed.

The driving computations would all be held in the car itself. What I meant by data was simple signals that tell it "Ok, let this lose and allow it to move left" ect.

The magnets pulling on it is much like costing in a car today. Costing is a way to conserve gas mileage and put money in your wallet. The car is moving from the momentum it already obtained from accelerating before.

Also, the auto drive system I mentioned was as a backup. Something as a precaution. You have all heard the news over the years, truckers and such falling asleep at the wheel...
