razorblade001 wrote on Sat, 10 November 2007 00:34No, that isn't what I meant. The grips on the roads wouldn't technically advanced at all, other than being able to allow a car to freely switch or change lanes when needed.

The driving computations would all be held in the car itself. What I meant by data was simple signals that tell it "Ok, let this lose and allow it to move left" ect.

The magnets pulling on it is much like costing in a car today. Costing is a way to conserve gas mileage and put money in your wallet. The car is moving from the momentum it already obtained from accelerating before.

Also, the auto drive system I mentioned was as a backup. Something as a precaution. You have all heard the news over the years, truckers and such falling asleep at the wheel...

Just not plausible and really inst well thought out. Have you ever driven across Texas? It's 10 hours at 60mph....That a hell of a lot of metal and maintenance.

Everything will be recorded by simple triangulation using sensors and good old fashion simplification.
