alien life is a statistical certainty. there is a massive maths formula that works out the chances of a given planet having suitable conditions for life (its very small), but since the universe is infinite (according to current science) then so is the chance of there being life.

but the chance of such life communicating with us are mathematically insignificant due to the distance between planet systems. due to the speed of light, if we ever pick up a transmission then another maths formula states that species will have died out by the time it reaches us (and the same with our transmissions)
