Since your home server is connected to a USB HDD where all your server data will be stored, your 1Gbps would be pointless as USB cannot transmit anywhere near that. You wouldn't notice any difference whatsoever. You can only read/write as fast as your HDDs let you.

For example you could have a 100Gbps internet connection which is great but you couldn't use it because your HDD wouldn't be able to keep up with the amount of data.

Basically it would be like having a Nvidia 8800GTX in a P4 Celeron 1.8 with a crappy mobo. Totally useless.
