What you see on resident evil is just some fiction. How would a body move if the blood is coagulated? After some hours, the whole "inerior" of the body is too dry to allow any movement.

When they kill a zombie in the first movie, they realize the blood is coagulated. It's already a mistake in the movie.

Anyway, it's not impossible that we find a way to regenerate dead cells constantly. Some of our cells already does that. Unfortunately, the brain cells do not.

So who knows, If you had to try to explain to some people in the year 1500 (when people knew already that the earth was a sphere) that some day the man will walk on the moon, they would just laugh at you or burn you in the middle of the market... But still, 500 hundred years later, men are talking now about going to Mars...
