You mean like in the extremely accurate documentary "The Core?"

No.

EvilWhiteDragon wrote on Sun, 06 January 2008 15:17

Actually wiping it away would perhaps be possible by detonating enough bombs near weak spots of the earth, but that would still be difficult...

"Enough bombs" would be defined as billions and billions of megaton bombs with 100% efficiency.

To quote from the site in my profile:

"The Earth is built to last. It is a 4,550,000,000-year-old, 5,973,600,000,000,000,000-tonne ball of iron. It has taken more devastating asteroid hits in its lifetime than you've had hot dinners, and lo, it still orbits merrily."
