I wanted the most powerful graphics card I could get without buying a new power supply (2.75 to 2.81GHz). This card I might: add runs renegade with shaders on, at max resolution, and gets about 40-50 fps.

They made a PCI version of the Geforce 6800? News to me.

There sin't only a PCI-e version afaik. But that wont work on a normal PCI slot so

They made a AGP version as well but that was my point, no good recommending a card that the topic starter cannot use.
