i have it because of that and the toolbars
plus its got some nifty features

- Window management

Quickly move windows between monitors or maximize a window to the desktop using the additional window buttons added by UltraMon.

- Smart Taskbar

UltraMon adds an additional taskbar for each secondary monitor, and each taskbar only shows tasks from the monitor it is on. This makes managing lots of open applications much easier, and when activating an application, you'll know on which monitor it will appear.

- Application positioning

Use the UltraMon tabs added to a shortcut's properties to set an application's position or use custom display settings when the application is running.

- Display profiles

With display profiles, you can quickly change the settings of one or more monitors. You can also create a display profile that gets applied when logging in, especially useful when the computer is used by more than one person, and not everyone wants to use the same display settings.

- Desktop wallpaper

The UltraMon wallpaper manager adds the ability to use a different picture on each monitor, or stretch a single picture across the desktop.

- Screen savers

Most screen savers only run on the primary monitor. UltraMon can blank the secondary monitors when the screen saver is running, or run additional screen savers on secondary monitors.

- Mirroring

Mirror the primary monitor on one or more secondary monitors, for example when doing a presentation. A unique feature is support for different resolutions, the primary monitor can run at a higher resolution for example. Mirroring is only available on Windows 2000 and XP.

- Use more than 10 monitors

UltraMon provides a custom Display Settings applet with support for configuring more than 10 monitors. You can quickly configure even large numbers of monitors using the included monitor arrangement tools.
