No, "Server IP" is either

- 1). The IP of your router, which is at the end of the table (1 or 255) or,
- 2). The IP of your computer, which is an internal one and has the same 2-3 octets as the rest of the network.

Ports are usually 4848 on UDP and TCP protocols (not sure on TCP, do it to be safe) unless the server admin has changed them.
