If you could help I would so appreciate it. I have tried to install Renegade to my iMac using Fusion, but can't even make it to the install screen. I put in the disk and the autolaunch appears, but then when I click on 'install' it crashes... I get the windows error 'Setup has experienced a problem and needs to close' with the accompanying send error to M\$ option. Please tell me this can be overcome - that is the whole reason we bought Fusion was this one game. My kids (and I) are distraught. Please help...
