Its people like you and the topic starter which prove to the world how arrogant Americans are...have you ever even briefly actually researched you theory? That idea was brought up in like 2001, and shutdown within the same month. A good visual thing that proves how wrong you are, shows that this time it is warming MUCH MUCH MUCH MUCH MUCH MUCH MUCH more that it has ever before (within the past 1000 years, naturally).

Want to continue using that argument without actually knowing what you are talking about? I'd say you shoot that entire statement back in your own direction.

It's people like YOU who show the rest of the world how gullible and easily led on some Americans are. You take a graph or two and summarize the entire issue with those two pieccs of evidence making a generalized and completely uneducated and unresearched statement from those without taking the time to follow up on your on research.

I present this little piece of data that not many people know about:

This is a graph of the average global temperature vs. the number of temperature monitoring stations around the world. Note the sudden decrease of the number of stations at the same time as the suddden increase of global temperature. Coincidence? I think not.

I also present The Petition Project. This is a group of 30000 scientists and doctors who have signed this petition urging the U.S. to reject the global warming agreement written in Japan in December 1997, stating that there is no conclusive evidence that without-a-doubt proves that global warming is mainly due to human cause. Note the petition on the front page signed by Edward Teller, the world famous physicist known for his help with the atomic bomb.

And finally:

Al Gore's house uses 20x the amount of energy an average house would use.
