Hi,

I was wondering anyone here who had trouble learning PHP?

Because it's something that was part of my study for the last year. But I still can't master it. I know `<?php echo "hello world"?>` And I understand what variables/ for and while loops are for.

But I have yet to manage on building something myself. (A small code that I thought out myself)

I want to build a website in PHP. As I know how to build websites in HTML.

I have tried programming in Javascript, VBA and PHP. For some reason I don't understand the logic behind programming or it's just not being thought me well.

Anyone got advice? I got 2 weeks to master at least the basics..  
thats the time I am willing on spending as I have got to work after..

I got a small book but writing over code's didn't help me the last time and it got extremely boring.

So far I thought of

- w3schools
- the small PHP book that I have as reference
- google, official PHP site

Anyone else got advice on how to learn PHP? How did you master PHP?

Thanks in advance
