CarrierII wrote on Thu, 07 August 2008 08:45On Vista:
Start > Control Panel > Network and Sharing Center
Click on "Manage Wireless connections" and remove any networks that you no longer want
(including the one you're trying to connect to, you have to change it's type...)

Start > Connect To. Windows will state it can't find any wireless networks (because you disabled
SSID broadcast) so you have to click on "Setup new connection" or whatever it is at the bottom
that lets you make a new connection, from the connection types menu, choose wireless AP /
Router (NOT the "Ad hoc" one) and then enter the SSID, Passkey and set the encryption type.
Click "Save" or whatever, and then see what happens.

Also, try Windows help and Here!

thank you

my printer was connected to my network but since my network is WPA2 my printer Manuel says it
can only connect WPA-PSK so will it still work?
