Nothing has been proven to happen, the only people criticizing the project aren't very creditable and probably on crack. They don't know what they're talking about. No one knows exactly what will happen, but we do know what won't happen. The thought of "mini black holes consuming the planet" and "stranglets" is ridiculous.

These collisions that we're experimenting with happen every second of every day in nature (but with much much much more energy), the reason to build such a thing is to see what exactly happens when they collide.
