---

I was just happily playing Renegade online, when suddenly, out of the blue, the screen froze! I opened my windows task bar, but it didn't open! It just went to the main Windows screen. It still said Windows Task Bar on a window at the bottom of the screen, but it froze every time I tried to open it! There were also three other windows that were at the bottom of the screen: Renegade Resurrection, Renegade, and Renegade Application Error. If I tried to open any of them it would freeze and I'd have to supposedly open the windows task bar again. I tried over and over, to see what the Renegade Application Error was, but I had to close it first without seeing it so my PC would run properly. I tried to load another Renegade game again, but it showed the same thing I've been explaining to you. So if you know how to fix this, PLEASE TELL ME!!!
